## Student Exploration: Equilibrium and Pressure

[Note to teachers and students: This Gizmo ${ }^{\text {TM }}$ was designed as a follow-up to the Equilibrium and Concentration Gizmo. We recommend doing that activity before trying this one.]

Vocabulary: Dalton's law, Le Châtelier's principle, partial pressure, pressure

Prior Knowledge Questions (Do these BEFORE using the Gizmo.)
A typical scuba tank has a volume of 11 liters and can support a diver for one hour. An adult breathes about 3 liters of air with each breath.

1. How can an 11 -liter tank give a diver enough oxygen for one hour? $\qquad$
$\qquad$
$\qquad$
2. Why are diving cylinders made of thick, reinforced aluminum or steel?

## Gizmo Warm-up

Gases consist of billions of tiny particles in constant motion, colliding with each other and the walls of the container. The sum of all these collisions creates pressure on the walls of the container. In theory, any amount of gas can be squeezed into a container if the container is strong enough to withstand the gas pressure.

The Equilibrium and Pressure Gizmo shows a mixture of gases in a chamber. The lid of the chamber can move up or down.

1. Check that Reaction $\mathbf{1}$ is selected. Use the Moles $\mathbf{N O}_{2}$ slider to increase the number of $\mathrm{NO}_{2}$ molecules in the chamber. How does this affect the volume of the chamber?
2. Notice the weights on the lower right side of the Gizmo. Drag several of these weights to the lid. How does this affect the volume of the chamber?

| Activity A: | Get the Gizmo ready: <br> - Remove all weights from the lid. |  |
| :--- | :--- | :--- |
| Dalton's law | - Set Moles $\mathrm{NO}_{2}$ and Moles $\mathrm{N}_{2} \mathrm{O}_{4}$ to 0. |  |

Introduction: In a mixture of gases, each gas contributes a partial pressure to the total pressure in the chamber. Because the chamber has a moveable piston, the pressure inside is equal to the pressure on the lid. In this Gizmo, the units of pressure are megapascals (MPa).

## Question: How do individual gases contribute to the total pressure in a chamber?

1. Observe: Set Moles $\mathrm{NO}_{2}$ to 2 to add 2 moles of $\mathrm{NO}_{2}$ gas to the chamber.
A. The total pressure $(P)$ on the chamber is shown next to the weights, at bottom right.

What is the total pressure in the chamber? $\qquad$
B. Select the BAR CHART tab and select Pressure. Turn on Show data values.

What is the pressure of $\mathrm{NO}_{2}$ ?

$$
P_{\text {NO2 }}=
$$

2. Observe: Set Moles $\mathrm{N}_{2} \mathrm{O}_{4}$ to 2 to add 2 moles of $\mathrm{N}_{2} \mathrm{O}_{4}$ gas to the chamber.
A. What is the total pressure on the chamber? $\qquad$
B. What are the partial pressures of $\mathrm{NO}_{2}$ and $\mathrm{N}_{2} \mathrm{O}_{4}$ ? $\quad P_{\mathrm{NO} 2}=$ $\qquad$ $P_{\text {N } 204}=$ $\qquad$
C. What is the sum of the partial pressures of $\mathrm{NO}_{2}$ and $\mathrm{N}_{2} \mathrm{O}_{4}$ ? $\qquad$
Dalton's law states that the total pressure in a container is equal to the sum of the partial pressures: $P=P_{1}+P_{2}+\ldots .+P_{n}$
3. Explain: Why doesn't the total pressure increase when more gas is added to the chamber? (Hint: What would you see if the volume of the chamber was fixed?)
4. Analyze: A molecule of $\mathrm{N}_{2} \mathrm{O}_{4}$ has twice the mass as a molecule of $\mathrm{NO}_{2}$. What do you notice about the partial pressure exerted by 2 moles of $\mathrm{NO}_{2}$ compared to the partial pressure exerted by 2 moles of $\mathrm{N}_{2} \mathrm{O}_{4}$ ?

At a given temperature, the partial pressure exerted by a gas depends only on the quantity of the gas, not on its mass. Thus a mole of a light gas such as hydrogen $\left(\mathrm{H}_{2}\right)$ exerts the same pressure as a mole of a heavier gas such as dinitrogen tetroxide $\left(\mathrm{N}_{2} \mathrm{O}_{4}\right)$.

\section*{Activity B: $\quad$ Get the Gizmo ready: <br> Partial pressure and equilibrium <br> - Select Reaction 2. <br> - Move the Sim. speed slider all the way to the right. <br> | $\mathrm{NO}_{2}$ | 8 | $\mathrm{~N}_{2} \mathrm{O}_{4}$ |
| :--- | :--- | :--- |
| NO | $\infty$ |  |
| $\mathrm{N}_{2} \mathrm{O}_{5}$ | 008 |  |}

Introduction: In the Equilibrium and Concentration Gizmo, you found that reversible reactions eventually result in chemical equilibrium. Chemical equilibrium is reached when the rates of the forward and reverse reactions are the same. The constant $K_{c}$ describes the ratio of products to reactants at equilibrium. A similar equilibrium can be calculated based on partial pressure.

## Question: How can partial pressure be used to measure equilibrium?

1. Review: What is the formula of $K_{c}$ for reaction 2? Assume [ NO ] is the equilibrium concentration of $\mathrm{NO},\left[\mathrm{NO}_{2}\right]$ is the equilibrium concentration of $\mathrm{NO}_{2}$, and $\left[\mathrm{N}_{2} \mathrm{O}_{3}\right]$ is the equilibrium concentration of $\mathrm{N}_{2} \mathrm{O}_{3}$.

$$
K_{c}=
$$

2. Gather data: Experiment with a variety of initial partial pressures of $\mathrm{NO}, \mathrm{NO}_{2}$, and $\mathrm{N}_{2} \mathrm{O}_{3}$. For each set of initial partial pressures, use the Gizmo to determine the equilibrium partial pressures of each gas. Run three trials for each set of initial conditions. Use the data you collect to fill in the first four columns of the table. (Note that some $\mathrm{NO}_{2}$ molecules combine to form $\mathrm{N}_{2} \mathrm{O}_{4}$, so there may be less free $\mathrm{NO}_{2}$ than NO .)

| Init. $\boldsymbol{P}_{\text {NO }}$ <br> (MPa) | Init. $\boldsymbol{P}_{\text {NO2 }}$ <br> (MPa) | Init. $\boldsymbol{P}_{\text {N2O3 }}$ <br> (MPa) | Eq. $\boldsymbol{P}_{\text {NO }}$ <br> (MPa) | Eq. $\boldsymbol{P}_{\text {NO2 }}$ <br> (MPa) | Eq. $\boldsymbol{P}_{\text {N2O3 }}$ <br> (MPa) | $\frac{\boldsymbol{P}_{\text {N2O3 }}}{\boldsymbol{P}_{\text {NO }} \cdot \boldsymbol{P}_{\text {NO2 }}}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |

3. Calculate: In the last column of the table, calculate the ratio of equilibrium partial pressures as shown. What do you notice about the values in the last column? $\qquad$

## (Activity B continued on next page)

## Activity B (continued from previous page)

5. Analyze: The equilibrium constant can be expressed in terms of partial pressure $(P)$ or concentration. The symbol $K_{p}$ is used when partial pressure calculations are used. For the general chemical equation $\mathrm{aA}(g)+b \mathrm{~B}(g) \leftrightarrow c \mathrm{C}(g)+d \mathrm{D}(g)$ we have:

$$
K_{p}=\frac{\left(P_{C}\right)^{c}\left(P_{D}\right)^{d}}{\left(P_{A}\right)^{a}\left(P_{B}\right)^{b}} \quad K_{c}=\frac{[\mathrm{C}]^{c}[\mathrm{D}]^{d}}{[\mathrm{~A}]^{a}[\mathrm{~B}]^{b}}
$$

(Note: The symbols $a, b, c$ and $d$ represent coefficients for substances A, B, C, and D.)
How are the equations for $K_{p}$ and $K_{c}$ similar? $\qquad$
$\qquad$
6. Explore: Select Reaction 3. In this reaction, a solid (C) reacts with a gas $\left(\mathrm{CO}_{2}\right)$ to produce another gas (CO). To see how the solid affects the equilibrium, record the equilibrium partial pressures of $\mathrm{CO}_{2}$ and CO for each initial amount of C . Leave the last column blank for now.

| Initial C (moles) | Initial $\mathrm{CO}_{2}$ (moles) | Initial CO (moles) | Equilibrium $P_{\text {co2 }}$ (MPa) | Equilibrium $P_{c o}$ (MPa) | $K_{p}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 30 | 8 | 8 |  |  |  |
| 40 | 8 | 8 |  |  |  |
| 50 | 8 | 8 |  |  |  |
| 60 | 8 | 8 |  |  |  |

7. Analyze: If possible, compare your results to those of your classmates. Based on your results, how does the initial amount of carbon (C) affect the equilibrium partial pressures of the two gases? Are there any consistent trends in the data?
$\qquad$
$\qquad$
8. Calculate: Because solids do not contribute to the pressure in the chamber, the amount of solid does not affect the equilibrium partial pressures of the gases. To calculate $K$ in this reaction, ignore the solid:

$$
K_{p}=\frac{P_{C O}^{2}}{P_{C O 2}} \quad K_{c}=\frac{[\mathrm{CO}]^{2}}{\left[\mathrm{CO}_{2}\right]}
$$

Use this equation to calculate $K_{p}$ for each trial and fill in the last column of the table.
9. Think and discuss: On a separate sheet, explain why the amount of solid does not affect the equilibrium as long as there is enough solid to cover the bottom of the container.

| Activity C: | Get the Gizmo ready: | L Click Reset. Select Reaction 2. |
| :--- | :--- | :--- |
| Le Châtelier's <br> principle | - Set Moles NO, Moles $\mathrm{NO}_{2}$, and Moles $\mathrm{N}_{2} \mathrm{O}_{3}$ to 5. |  |

Introduction: In the Equilibrium and Concentration Gizmo, you learned that you can predict the direction of a reaction by comparing the reaction quotient ( $Q_{c}$ ) with the known equilibrium constant $K_{c}$. You can do the same thing using partial pressures:

$$
Q_{p}=\frac{\left(P_{C}\right)^{c}\left(P_{D}\right)^{d}}{\left(P_{A}\right)^{a}\left(P_{B}\right)^{b}}
$$

## Question: How do changes in pressure affect the reaction equilibrium?

1. List: Click Play $(>)$. Select the BAR CHART tab, allow the reaction to proceed to equilibrium, and then click Pause (II). What are the equilibrium partial pressures?
$P_{\text {No }}$ $\qquad$ $P_{\text {NO2 }}$ $\qquad$ $P_{\text {N2O3 }}$ $\qquad$
2. Calculate: Calculate $K_{p}$ for this reaction. $K_{p}=$ $\qquad$
3. Predict: If you add weight to the lid, it increases the pressure on the chamber.
A. How do you expect increasing pressure on the chamber to affect the partial pressures of the gases? $\qquad$
$\qquad$
B. How do you expect the increased pressure to affect the equilibrium? $\qquad$
$\qquad$
4. Calculate: Add all five weights to the lid.
A. What is the partial pressure of each substance now?

$$
P_{N O}
$$

$P_{\mathrm{NO} 2}$ $\qquad$
$P_{\text {N2O3 }}$ $\qquad$
B. Calculate $Q_{p}$ for this setup.
$Q_{p}=$ $\qquad$
C. In the current situation, is there an excess or products or reactants? $\qquad$
Explain: $\qquad$
(Activity C continued on next page)

## Activity C (continued from previous page)

5. Test: Click Play. Allow the reaction run until it reaches equilibrium again.
A. What is the partial pressure of each substance now?
$P_{\text {NO }}$ $\qquad$
$P_{\text {NO2 }}$ $\qquad$ $P_{\text {N2O3 }}$ $\qquad$
B. Calculate $K_{p}$ for this setup.

$$
K_{p}=
$$

C. How does this value of $K_{p}$ compare to the value you found before? $\qquad$
$\qquad$
D. As the experiment reached equilibrium again, did the reactants or products increase?

As the pressure on the system increased, the reaction shifted toward the side with fewer molecules-in this case the products. You may have noticed the volume of the chamber decreased slightly as the reaction proceeded. This is an example of Le Châtelier's principle, which is the tendency of a system in equilibrium to shift in response to a change.
6. Apply: Select Reaction 5. If you were making water $\left(\mathrm{H}_{2} \mathrm{O}\right)$ from oxygen $\left(\mathrm{O}_{2}\right)$ and hydrogen $\left(\mathrm{H}_{2}\right)$, would it be an advantage to increase the pressure? Explain your answer, and then use the Gizmo to check your work.
$\qquad$
$\qquad$
$\qquad$
7. Think and discuss: Why do you think increasing the pressure has the effect of shifting the equilibrium toward the side with fewer molecules? If possible, discuss your answer with your classmates and teacher.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
